Claim 27; Pages 91-95; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase.

CI thay be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant preeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the propagated hybrids and could shorten and simplify the breeding programs that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with Specific stable traits for such characteristics as height, seed and forage quality and maturity.

The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant the redding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plant breeding; ss.

        production of apomictic seeds - useful in plant breeding Claim 21; Pages 40-46; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides
                                                                                                                                                                                                                                                                                                                                                                                                                                    intron

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 26; Pages 64-67; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac: The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

DNA encoding plant morphogenesis regulatory protein - useful plants with short stems or altered inflorescence yield plants with short stems or altered inflorescence claim 1; Pages 6-10; 17pp; Japanese.

The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to a plant with, e.g. short stems or altered inflorescence. The acts on a plant at a specific site for a specific period, and
                                                                                                                                                                                                                                        04-MAR-1997.

                           Increasing plant pathogen resistance by induction of variegation—may lead to acquired resistance to a broad range of pathogens.

Claim 9; Page 85-87; 31pp; English.

T06307 is a tomato pathogen resistance gene Cf-2.2 partial cDNA clone. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagales of plants) containing such constructs. Cf-2.2 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum. C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               therefore be used to regulate extraneous gene expression plant. The MRP'S CDNA or genomic DNA can be used to transplant to increase its MRP expression, and therefore control (particularly stem length) of the plant.

                                                         increasing plant pathogen resistance by induction of variegation may lead to acquired resistance to a broad range of pathogens.

Claim 9; Page 80-83; 131pp; English.

T06306 is the tomato pathogen resistitance gene Cf-2.1. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.1 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum.

C.fulvum containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

PS Claim 3; Fig 1a; 75pp; English.

CC This sequence is an example of the polynucleotide of the invention, and CC is able to confer pathogen resistance on a plant. It is one of two tomato CC is gene variants, which offer resistance against the pathogen CC CF-5 gene variants, which offer resistance against the pathogen CC cladosporium fulvum-5. Transgenic plants can be produced by incorporating CC the gene into plant cells and regenerating plants from the cells; CC assaually produced offspring can also be subsequently CC produced. Expression of the gene in plant cells can confer pathogen CC resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. CC oligonucleotides with sequences complementary to the gene expression. The CC identify other genes/fragments conferring pathogen resistance on plants CC identify other genes/fragments conferring pathogen resistance on plants CC e.g. phytophthora resistance in potatoes. Homologies between Cf-5 and CC cf-9 may be used to identify further resistance genes of this class.

                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is an example of the polynucleotide of the invention, and clist able to confer pathogen resistance on a plant. It is one of two tomato CC F-5 gene variants, which offer resistance against the pathogen cC Cladosporium fulvum-5. Transgenic plants can be produced by incorporating the gene into plant cells and regenerating plants from the cells; cC asexually or sexually produced offspring can also be subsequently cC produced. Expression of the gene in plant cells can confer pathogen cC resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. CO iligonucleotides with sequences complementary to the gene or fragments cC of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides are useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants cC e.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and CC cf-9 may be used to identify further resistance genes of this class.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                뭐
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     д
                                                                             Pr Tomato gene Cf-5, confers resistance to Cladosporium fulvum - useful pr for production of transgenic plants resistant to pathogens e.g. Pr tomato leaf mould C. fulvum in tomatoes

PS Disclosure; Fig 7; 75pp; English.

CC This sequence is a clone of the polynucleotide of the invention, which offer creates a clone of two tomatoes of a plant. The polynucleotide of the invention is one of two tomato CF-5 gene variants, which offer creatistance against the pathogen resistance on a plant cells and cc resistance against the pathogen Cladosporium fulvum-5. Transgenic plants can be produced by incorporating the gene into plant cells and cc regenerating plants from the cells; asexually or sexually produced confepring can also be subsequently produced. Expression of the gene in confer pathogen resistance on a plant e.g. to tomato leaf complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides care useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants e.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and Cf-9 may be used to identify sequence 4123 BP; 1253 A; 742 C; 725 G; 1403 T;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.

         /note-"Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated eticlated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1 day germinated eticlated seedilings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cpt inserts were directionally cloned with Sal-Not arms usioning of primed cDNA.

The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark- rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. "
